Emotimeter

The emotimeter is an app where you can get your facial expressions detected and they will display the most dominant expression on your face while giving the percentage of how dominant it is among the others.

App Link:**https://play.google.com/store/apps/details?id=com.reaimagine.josem.emotimeter_facialemotionrecognizer&hl=en**

How many emotions can it recognize?

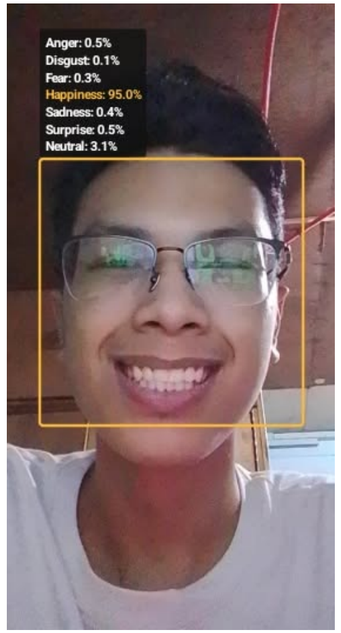

It can recognize 7 emotions such as, Happy, Sad, Neutral, Angry, Surprised, Disgust and Fear. However, it can only accurately recognize 6 emotions because it can hardly detect the emotion of Disgust.

Attempt to make Faces

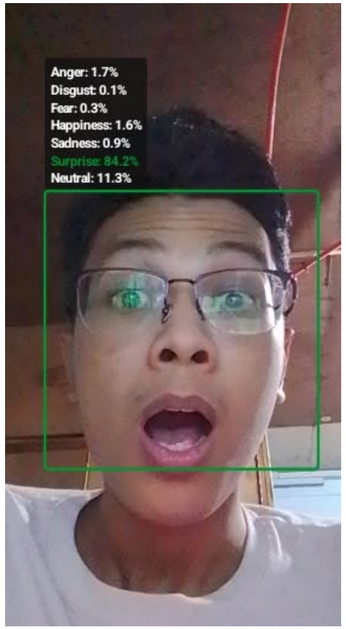

Happy

Sad

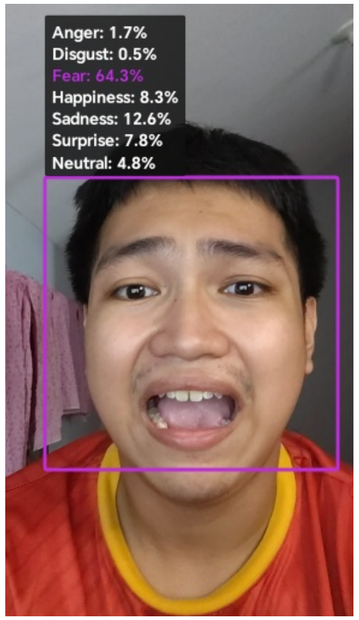

Neutral

Surprised

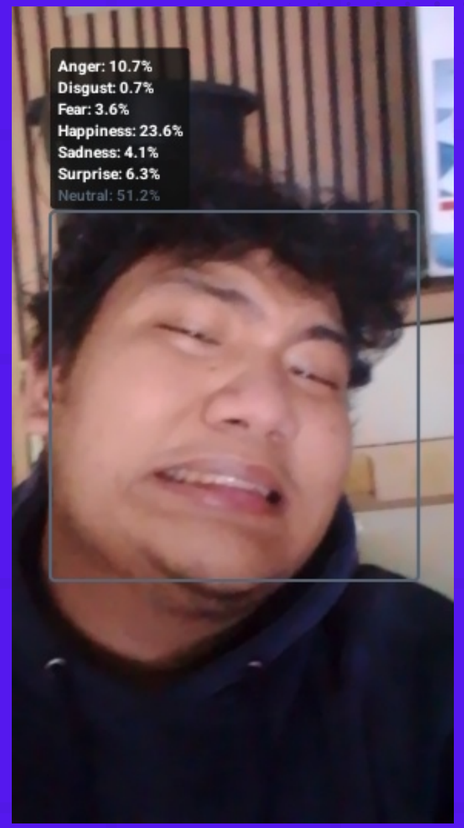

Angry

Fear

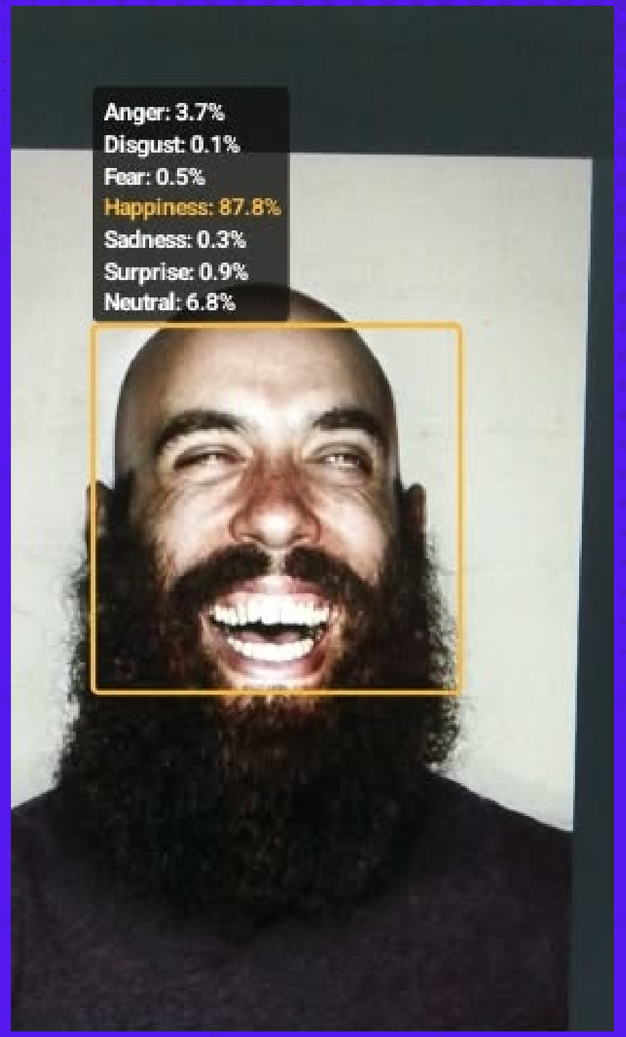

Attempt to do digusted face

What if someone with a beard tries the application?

It’s still able to process and render the information of the user’s face even though some portion of it is covered in beard.

What ethical issues does facial recognition raise?

It raises issues in terms of privacy because we never know sometimes as to where these photos are being used especially on apps that really uploads the taken images on their own server, so it risks the potential issue for data privacy. But for this particular application, Emotimeter has ensured to keep these images safe because they will not have access to the photos the users take, rather, it would only be saved locally through the user's phone.

How well would the recognition software work when used in a more natural setting where the user is not making a face for the camera?

It would be less accurate in a natural setting because contributing factors such as the light, angle and natural expressions may affect the detection of the app and might think that you're making an expression even though you're in a natural state

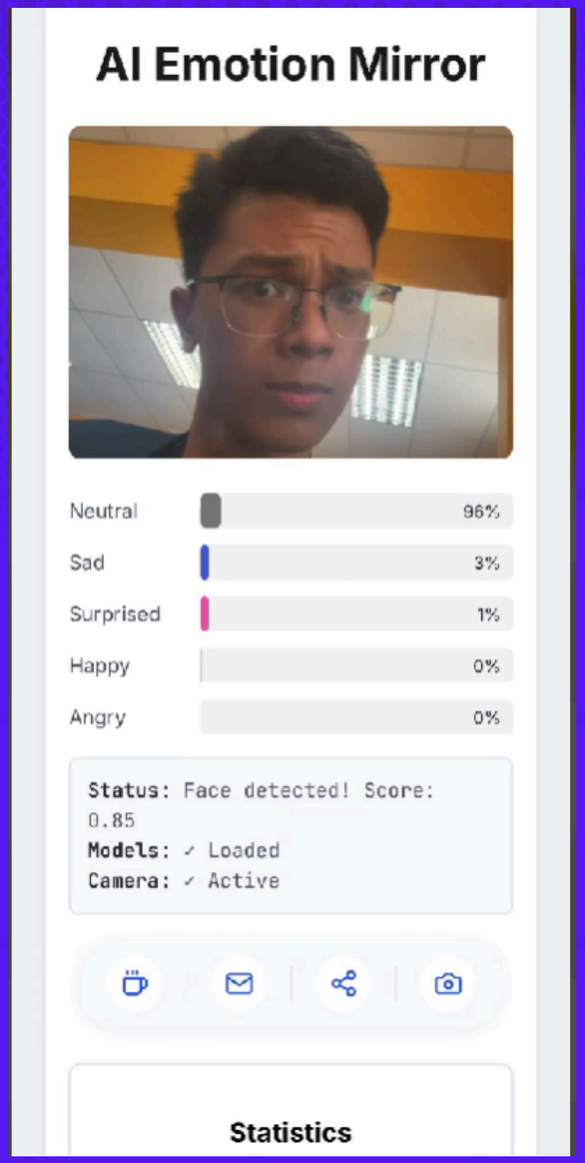

Where can we use the app?

We can use it for personal use, such as for entertainment or playing around with your friends. This can also be used for educational purposes like for how facial recognition works. And as well as for research, because this can be used to explore and research on how facial expressions are detected by AI.

- Personal Use
